(cuda)Hashcat

Hashcat

„Installation“ unter Apple Macintosh OS X 10.11.x:

```
$ cd Downloads
$ wget http://hashcat.net/files/hashcat-2.00.7z
[...]
$ 7z x hashcat-2.00.7z
[...]
$ cd hashcat-2.00
```

SHA512 (Linux)

Welche Benutzer gibt es auf dem System (Debian GNU/Linux)?

```
debian$ cat /etc/passwd
[...]
everybody:x:1001:1001:Hashcat Test Account,,,:/home/everybody:/bin/bash
[...]
```

Wie werden die Passwörter auf dem System „gehasht“?

```
debian$ grep -E "^ENCRYPT_METHOD" /etc/login.defs
ENCRYPT_METHOD SHA512
```

Den „anzugreifenden“ Hash kopieren wir in eine Datei:

```
debian# grep -F "everybody" /etc/shadow | cut -d ":" -f 2 | tee
~/Downloads/everybody_shadow.sha512
$6$qzwwrTUI$ao79fjxzggxBezWq8fvUrKH20XiR5Y/VTKoMsJ9WXjbo7WZWMLbDYlamkwjoIV/N
G5WdoYN0RIPtIdNW6yLZa.
```

Welches Hashcat-„Modul“ kann solche Hashs „angreifen“?

```
osx$ ./hashcat-cli64.app --help | grep -F -i 'sha' | grep -F -i '512' | grep
-F -i 'unix'
  1800 = SHA-512(Unix)
```

Ich weiß „nur“, dass es sich um ein vierstelliges Passwort aus Kleinbuchstaben handelt (die Datei mit dem Hash habe ich bereits in das Verzeichnis von Hashcat kopiert!):

```
osx$ ./hashcat-cli64.app -m 1800 -a 3 everybody_shadow.sha512 ?l?l?l?l
Initializing hashcat v2.00 with 8 threads and 32mb segment-size...

Added hashes from file shadow_sha512.txt: 1 (1 salts)
```

```
Activating quick-digest mode for single-hash with salt

[s]tatus [p]ause [r]esume [b]ypass [q]uit => s

Input.Mode: Mask (?l?l?l?l) [4]
Index.....: 0/1 (segment), 456976 (words), 0 (bytes)
Recovered.: 0/1 hashes, 0/1 salts
Speed/sec.: - plains, 1.10k words
Progress..: 14200/456976 (3.11%)
Running...: 00:00:00:13
Estimated.: 00:00:06:43

$6$qzwwrTUI$ao79fjxzggxBezWq8fvUrKH20XiR5Y/VTKoMsJ9WXjbo7WZWMLbDYlamkwjoIV/N
G5WdoYN0RIPtIdNW6yLZa.:nstl
All hashes have been recovered

Input.Mode: Mask (?l?l?l?l) [4]
Index.....: 0/1 (segment), 456976 (words), 0 (bytes)
Recovered.: 1/1 hashes, 1/1 salts
Speed/sec.: - plains, 1.08k words
Progress..: 282948/456976 (61.92%)
Running...: 00:00:04:22
Estimated.: 00:00:02:41

Started: Sat Jan 16 11:04:28 2016
Stopped: Sat Jan 16 11:08:50 2016
```

Wenn ich alle Zeichen (nicht „nur“ Kleinbuchstaben) berücksichtigen möchte, dauert das ganze schon erheblich länger:

```
osx$ ./hashcat-cli64.app -a 3 -m 1800 everybody_shadow.sha512 ?a?a?a?a
Initializing hashcat v2.00 with 8 threads and 32mb segment-size...

Added hashes from file shadow_sha512.txt: 1 (1 salts)
Activating quick-digest mode for single-hash with salt

[s]tatus [p]ause [r]esume [b]ypass [q]uit => s

Input.Mode: Mask (?a?a?a?a) [4]
Index.....: 0/1 (segment), 81450625 (words), 0 (bytes)
Recovered.: 0/1 hashes, 0/1 salts
Speed/sec.: - plains, 1.09k words
Progress..: 13912/81450625 (0.02%)
Running...: 00:00:00:13
Estimated.: 00:20:44:04

[s]tatus [p]ause [r]esume [b]ypass [q]uit => q
```

```
[...]
```

NTLM (Windows)

Wenn „die“ Festplatte mit „der“ Windows-Installation unter Debian GNU/Linux 8.x unter „/media/user/222444A1244479B5“ automatisch eingehängt wurde, kopieren wir den NTLM-Hash eines bestimmten Benutzers wie folgt in eine Datei:

```
debian$ sudo aptitude install samdump2
[...]
debian$ cd /media/user/222444A1244479B5/Windows/System32/config
debian$ samdump2 SYSTEM SAM | grep -F "everybody" | cut -d ":" -f 4 | tee
~/Downloads/hashcat-2.00/everybody_SAM.ntlm
1ea1fd7b4931ec9255cda7cb6060b092
```

In dem selben 7z-Archiv (siehe oben) sind auch Binaries für Linux enthalten (die Installation ist vergleichbar einfach!):

```
debian$ ./hashcat-cli64.bin -a 3 -m 1000 everybody_SAM.ntlm ?a?a?a?a
Initializing hashcat v2.00 with 8 threads and 32mb segment-size...

Added hashes from file ../samdump2_modified.txt: 1 (1 salts)
Activating quick-digest mode for single-hash

[s]tatus [p]ause [r]esume [b]ypass [q]uit =>

Input.Mode: Mask (?a?a?a?a) [4]
Index.....: 0/1 (segment), 81450625 (words), 0 (bytes)
Recovered.: 0/1 hashes, 0/1 salts
Speed/sec.: 95.62M plains, 95.62M words
Progress..: 81450625/81450625 (100.00%)
Running...: --:--:--:--
Estimated.: --:--:--:--

Started: Tue Jan 19 15:33:35 2016
Stopped: Tue Jan 19 15:33:37 2016
```

Hier ist schon mit dem bloßen Auge erkennbar, dass NTLM-Hashes „etwas“ schneller berechnet werden können als SHA512-Hashes!

cudaHashcat

Installation unter Debian GNU/Linux 8.x (mit einem relativ alten Nvidia-Treiber):

```
$ sudo aptitude install libcuda1
[...]
```

```
$ mkdir ~/Downloads
$ cd Downloads
$ wget http://hashcat.net/files/cudaHashcat-2.01.7z
[...]
$ 7z x cudaHashcat-2.01.7z
[...]
$ cd cudaHashcat-2.01
```

SHA512 (Linux)

Analog zum „CPU-Durchgang“ (siehe oben) jetzt mit der (nicht wirklich potenten) GPU inkl. schreiben von Ergebnissen in eine Datei:

```
debian$ ./cudaHashcat64.bin -w 3 -m 1800 -a 3 -o outfile.txt
~/Downloads/shadow_sha512.txt ?l?l?l?l
cudaHashcat v2.01 starting...

Device #1: GeForce 605, 1023MB, 1046Mhz, 1MCU
Device #1: WARNING! Kernel exec timeout is not disabled, it might cause you

```

Was steht nun in der Datei?

```
$ cat outfile.txt
$6$qzwwrTUI$ao79fjxzggxBezWq8fvUrKH20XiR5Y/VTKoMsJ9WXjbo7WZWMLbDYlamkwjoIV/N
G5WdoYN0RIPtIdNW6yLZa.:nstl
```

NTLM (Windows)

Und das ganze mit einem NTLM-Hash:

```
debian$ cd ~/Downloads/cudaHashcat-2.01
debian$ ./cudaHashcat64.bin -w 3 -m 1000 -a 3 -o everybody_SAM.ntlm
everybody_PLAIN.txt ?l?l?l?l
cudaHashcat v2.01 starting...

ATTENTION!
  The wordlist or mask you are using is too small.
  Therefore, oclHashcat is unable to utilize the full parallelization power
of your GPU(s).
  The cracking speed will drop.
  Workaround:
https://hashcat.net/wiki/doku.php?id=frequently_asked_questions#how_to_creat
e_more_work_for_full_speed

INFO: approaching final keyspace, workload adjusted
```

```

Hier meckert die GPU-Version, da nicht genug Berechnungen paralellisiert werden können!

Lösung: kleine „Wortlisten“ der CPU übergeben und in einer anderen Konsole eine ergänzende größere „Wortliste“ der GPU übergeben!

Haben wir ein Ergebnis?

```
$ cat everybody_PLAIN.txt
1ea1fd7b4931ec9255cda7cb6060b092:nstl
```

Benchmark
